

## Winning Space Race with Data Science

Sanele Vakubi 18 June 2023

### **Outline**

- Executive Summary
- Introduction
- Methodology
- Results
- Conclusion
- Appendix

## **Executive Summary**

- Summary of methodologies:
  - Data Collection through an API
  - Data Collection through Web Scraping
  - Data Wrangling
  - Data Analysis with SQL
  - Data Analysis with Data Visualization (Python)
  - Interactive Visual Analytics with Folium
  - Machine Learning Prediction
- Summary of all results:
  - Exploratory Data Analysis
  - Interactive Visual Analytics (Screenshots)
  - Predictive Analytics

### Introduction

#### Project background and context:

SpaceX advertises Falcon 9 rocket launches on its website with a cost of 62 million dollars; other providers cost upward of 165 million dollars each, much of the savings is because SpaceX can reuse the first stage. Therefore if we can determine if the first stage will land, we can determine the cost of a launch. This information can be used if an alternate company wants to bid against SpaceX for a rocket launch. The goal of this project is to predict whether or not the Falcon 9 first stage will land successfully.

#### Problems you want to find answers:

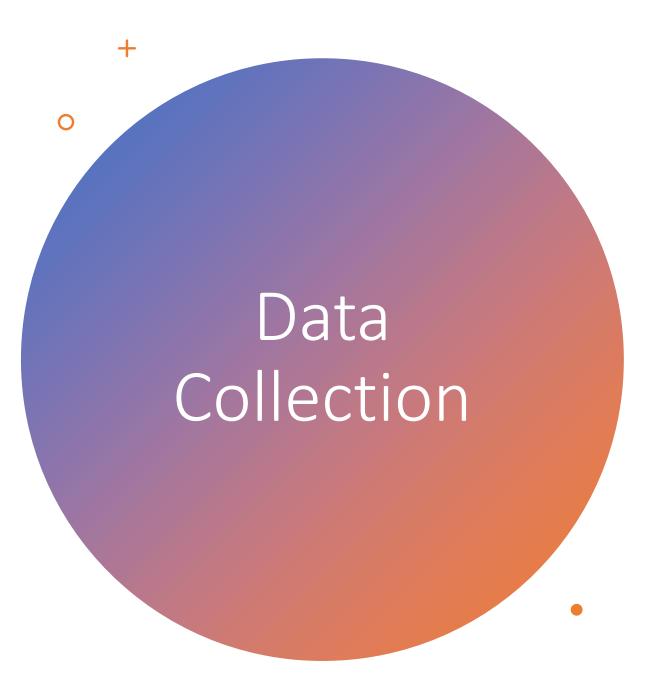

- What factors determine if the rocket will land successfully?
- The interaction between different variables that determine the success rate of a successful landing.
- What operating conditions need to be in place to ensure a successful landing program.

## Methodology

#### **Executive Summary**

- Data collection methodology:
  - Data was collected using SpaceX API and web scraping.
- Perform data wrangling
  - One-hot encoding was applied to the categorical features.
- Perform exploratory data analysis (EDA) using visualization and SQL
- Perform interactive visual analytics using Folium and Plotly Dash
- Perform predictive analysis using classification models
  - How to build, tune, evaluate classification models

- The data was collected using various methods:
- Data was collected using the 'get' request to the SpaceX API.
- Then, we decoded the response content as a Json using the .json() function call and turned it into a pandas dataframe using .json\_normalize() function call.
- We cleaned the data, checked for missing values and filled in the missing values where necessary.
- In addition, we performed web scrapping from Wikipedia for Falcon 9 launch records with BeautifulSoup.
- The objective was to extract the launch records as HTML table, parse the table and convert it to a pandas dataframe for future analysis.

```
1. Get request for rocket launch data using API
         spacex_url="https://api.spacexdata.com/v4/launches/past"
          response = requests.get(spacex url)
  2. Use json_normalize method to convert json result to dataframe
In [12]:
          # Use ison normalize method to convert the ison result into a dataframe
          # decode response content as ison
          static json df = res.json()
          # apply ison normalize
          data = pd.json normalize(static json df)
  3. We then performed data cleaning and filling in the missing values
[n [30]:
          rows = data falcon9['PayloadMass'].values.tolist()[0]
          df rows = pd.DataFrame(rows)
          df_rows = df_rows.replace(np.nan, PayloadMass)
          data_falcon9['PayloadMass'][0] = df_rows.values
          data falcon9
```

## Data Collection– SpaceX API

- We used the get request to the SpaceX API to collect data, clean the requested data and did some basic data wrangling and formatting.
- The GitHub URL for the notebook: <u>https://github.com/sanelemthandeni/lBM-DATA-SCIENCE---CAPSTONE-PROJECT/blob/main/jupyter-labs-spacex-data-collection-api.ipynb</u>

```
1. Apply HTTP Get method to request the Falcon 9 rocket launch page
   static url = "https://en.wikipedia.org/w/index.php?title=List of Falcon 9 and Falcon Heavy launches&oldid=1027686922"
      # use requests.get() method with the provided static url
      # assign the response to a object
      html data = requests.get(static url)
      html data.status code
Create a BeautifulSoup object from the HTML response
       # Use BeautifulSoup() to create a BeautifulSoup object from a response text content
       soup = BeautifulSoup(html data.text, 'html.parser')
     Print the page title to verify if the BeautifulSoup object was created properly
       # Use soup.title attribute
       soup.title
      <title>List of Falcon 9 and Falcon Heavy launches - Wikipedia</title>
   Extract all column names from the HTML table header
     column names = []
     # Apply find all() function with "th" element on first launch table
     # Iterate each th element and apply the provided extract column from header() to get a column name
     # Append the Non-empty column name ('if name is not None and Len(name) > 0') into a list called column names
     element = soup.find all('th')
     for row in range(len(element)):
            name = extract column from header(element[row])
            if (name is not None and len(name) > 0):
                column names.append(name)
4. Create a dataframe by parsing the launch HTML tables
Export data to csv
```

## Data Collection - Scraping

- We applied web scrapping to webscrap Falcon 9 launch records with BeautifulSoup
- We parsed the table and converted it into a pandas dataframe.
- The GitHub URL for the notebook:
   https://github.com/sanelemthandeni/I
   BM-DATA-SCIENCE---CAPSTONE PROJECT/blob/main/jupyter-labs webscraping.ipynb

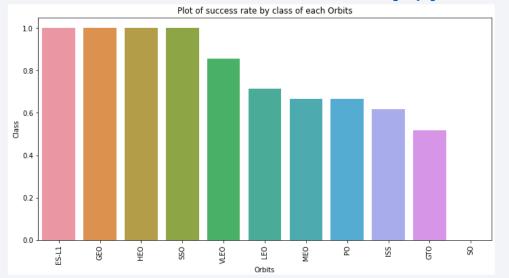

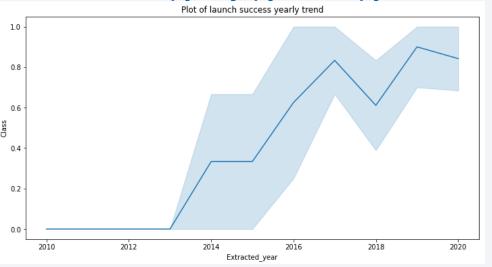

## Data Wrangling

- Describe how data were processed
- You need to present your data wrangling process using key phrases and flowcharts
- The GitHub URL for the notebook:
   https://github.com/sanelemthandeni/IBM-DATA-SCIENCE---CAPSTONE-PROJECT/blob/main/IBM-DS0321EN-SkillsNetwork labs module 1 L3 labs-jupyter-spacex-data wrangling jupyterlite.jupyterlite.jupyterlite.jpynb

### **EDA** with Data Visualization

- We explored the data by visualizing the relationship between flight number and launch Site, payload and launch site, success rate of each orbit type, flight number and orbit type, the launch success yearly trend.
- The GitHub URL for the notebook: <a href="https://github.com/sanelemthandeni/IBM-DATA-SCIENCE---CAPSTONE-PROJECT/blob/main/IBM-DS0321EN-SkillsNetwork labs module 2 jupyter-labs-eda-dataviz.ipynb.jupyterlite.ipynb">https://github.com/sanelemthandeni/IBM-DATA-SCIENCE---CAPSTONE-PROJECT/blob/main/IBM-DS0321EN-SkillsNetwork labs module 2 jupyter-labs-eda-dataviz.ipynb.jupyterlite.ipynb</a>

## EDA with SQL

- We loaded the SpaceX dataset into a PostgreSQL database without leaving the jupyternotebook.
- We applied EDA with SQL to get insight from the data. We wrote queries to find out for instance:
  - -The names of unique launch sites in the space mission.
  - -The total payload mass carried by boosters launched by NASA (CRS)
  - -The average payload mass carried by booster version F9 v1.1
  - -The total number of successful and failure mission outcomes
  - -The failed landing outcomes in drone ship, their booster version and launch site names.

## Build an Interactive Map with Folium

We marked all launch sites, and added map objects such as markers, circles, lines to mark the success or failure of launches for each site on the folium map.

We assigned the feature launch outcomes (failure or success) to class 0 and 1.i.e., 0 for failure, and 1 for success.

Using the color-labeled marker clusters, we identified which launch sites have relatively high success rate.

P We calculated the distances between a launch site to its proximities. We answered some question for instance:

## Build a Dashboard with Plotly Dash

- Summarize what plots/graphs and interactions you have added to a dashboard
- Explain why you added those plots and interactions
- Add the GitHub URL of your completed Plotly Dash lab, as an external reference and peer-review purpose

# Predictive Analysis (Classification)

- We loaded the data using Numpy and pandas, transformed the data, split our data into training and testing.
- We built different machine learning models and tune different hyperparameters using GridSearchCV.
- We used accuracy as the metric for our model, improved the model using feature engineering and algorithm tuning.
- We found the best performing classification model.
- The GitHub URL for the notebook:
   https://github.com/sanelemthandeni/IBM-DATA-SCIENCE---CAPSTONE-PROJECT/blob/main/IBM-DS0321EN-SkillsNetwork labs module 4 SpaceX Machine Learni

ng Prediction Part 5.jupyterlite.ipynb

## Results

EXPLORATORY DATA ANALYSIS RESULTS

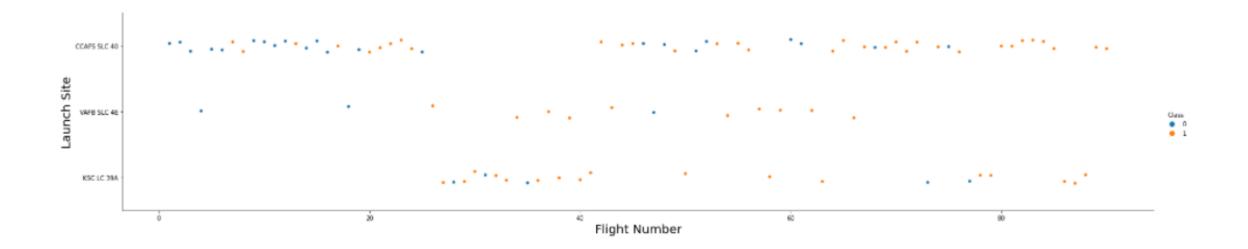

INTERACTIVE ANALYTICS DEMO IN SCREENSHOTS

PREDICTIVE ANALYSIS RESULTS

## Flight Number vs. Launch Site

• From the plot, we found that the larger the flight amount at a launch site, the greater the success rate at a launch site.

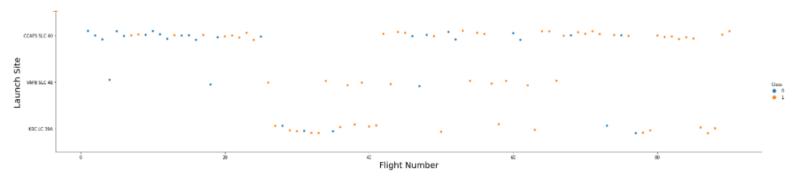

## Payload vs. Launch Site

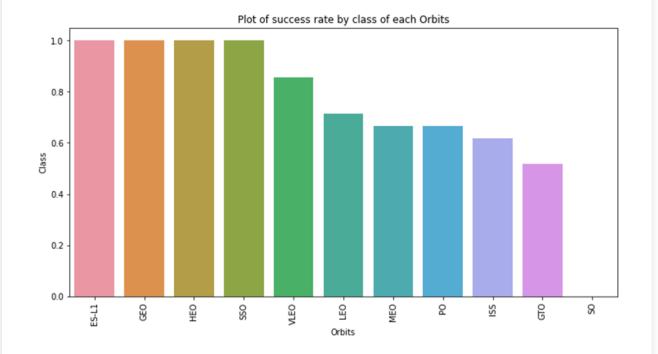

The greater the payload mass for launch site CCAFS SLC 40 the higher the success rate for the rocket.

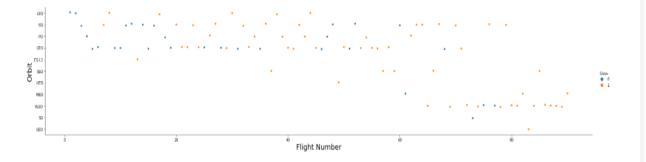

## Success Rate vs. Orbit Type

• From the plot, we can see that ES-L1, GEO, HEO, SSO, VLEO had the most success rate.

## Flight Number vs. Orbit Type

•The plot below shows the Flight Number vs. Orbit type. We observe that in the LEO orbit, success is related to the number of flights whereas in the GTO orbit, there is no relationship between flight number and the orbit.

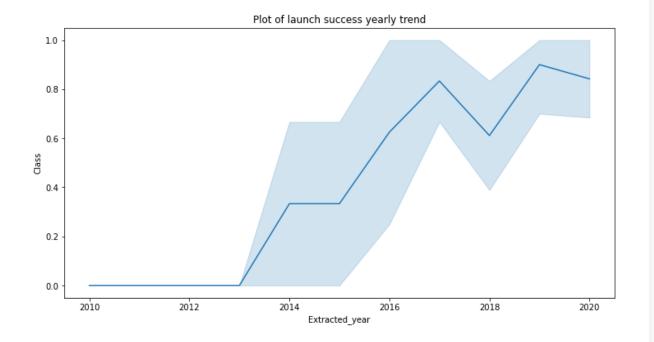

## | 100 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1000 | 1

## Payload vs. Orbit Type

 We can observe that with heavy payloads, the successful landing are more for PO, LEO and ISS orbits.

## Launch Success Yearly Trend

• From the plot, we can observe that success rate since 2013 kept on increasing till 2020.

### All Launch Site Names

 We used the key word DISTINCTto show only unique launch sites from the SpaceX data.

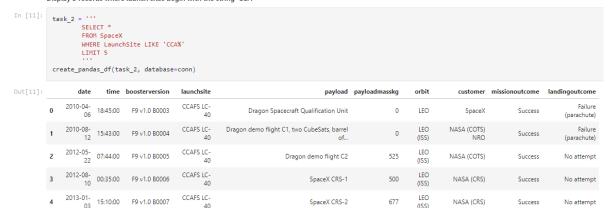

#### Display the names of the unique launch sites in the space mission

Out[10]:		launchsite
	0	KSC LC-39A
	1	CCAFS LC-40
	2	CCAFS SLC-40
	3	VAFB SLC-4E

## Launch Site Names Begin with 'CCA'

 We used the query above to display 5 records where launch sites begin with `CCA`

#### Display 5 records where launch sites begin with the string 'CCA'

### Total Payload Mass

 We calculated the total payload carried by boosters from NASA as 45596 using the query below

#### Display the total payload mass carried by boosters launched by NASA (CRS)

## Average Payload Mass by F9 v1.1

 We calculated the average payload mass carried by booster version F9 v1.1 as 2928.4

#### Display average payload mass carried by booster version F9 v1.1

## First Successful Ground Landing Date

 We observed that the dates of the first successful landing outcome on ground pad was 22ndDecember 2015

### Successful Drone Ship Landing with Payload between 4000 and 6000

 We used the WHEREclause to filter for boosters which have successfully landed on drone ship and applied the ANDcondition to determine successful landing with payload mass greater than 4000 but less than 6000

# Out[15]: boosterversion 0 F9 FT B1022 1 F9 FT B1026 2 F9 FT B1021.2 3 F9 FT B1031.2

## Total Number of Successful and Failure Mission Outcomes

 We used wildcard like '%' to filter for WHEREMissionOutcomewas a success or a failure.

#### List the total number of successful and failure mission outcomes

```
In [16]:
          task 7a = '''
                  SELECT COUNT(MissionOutcome) AS SuccessOutcome
                  FROM SpaceX
                  WHERE MissionOutcome LIKE 'Success%'
          task_7b = '''
                  SELECT COUNT(MissionOutcome) AS FailureOutcome
                  FROM SpaceX
                  WHERE MissionOutcome LIKE 'Failure%'
          print('The total number of successful mission outcome is:')
          display(create_pandas_df(task_7a, database=conn))
          print()
          print('The total number of failed mission outcome is:')
          create_pandas_df(task_7b, database=conn)
         The total number of successful mission outcome is:
            successoutcome
                      100
         The total number of failed mission outcome is:
Out[16]:
            failureoutcome
```

## Boosters Carried Maximum Payload

 We determined the booster that have carried the maximum payload using a subquery in the WHEREclause and the MAX() function. List the names of the booster\_versions which have carried the maximum payload mass. Use a subquery

Dut[17]:		boosterversion	payloadmasskg
	0	F9 B5 B1048.4	15600
	1	F9 B5 B1048.5	15600
	2	F9 B5 B1049.4	15600
	3	F9 B5 B1049.5	15600
	4	F9 B5 B1049.7	15600
	5	F9 B5 B1051.3	15600
	6	F9 B5 B1051.4	15600
	7	F9 B5 B1051.6	15600
	8	F9 B5 B1056.4	15600
	9	F9 B5 B1058.3	15600
	10	F9 B5 B1060.2	15600
	11	F9 B5 B1060.3	15600

## 2015 Launch Records

 We used a combinations of the WHEREclause, LIKE, AND, and BETWEENconditions to filter for failedlanding outcomes in drone ship, their booster versions, and aunch site names for year 2015 List the failed landing\_outcomes in drone ship, their booster versions, and launch site names for in year 2015

## Rank Landing Outcomes Between 2010-06-04 and 2017-03-20

- We selected Landing outcomes and the COUNTof landing outcomes from the data and used the WHEREclause to filter for landing outcomes BETWEEN2010-06-04 to 2010-03-20.
- We applied the GROUP BY clause to group the landing outcomes and the ORDER BY clause to order the grouped landing outcome in descending order.

SELECT LandingOutcome, COUNT(LandingOutcome) WHERE DATE BETWEEN '2010-06-04' AND '2017-03-20' GROUP BY LandingOutcome ORDER BY COUNT(LandingOutcome) DESC create pandas df(task 10, database=conn) Out[19]: landingoutcome count No attempt 10 Success (drone ship) Failure (drone ship) Success (ground pad) Controlled (ocean) Uncontrolled (ocean) Precluded (drone ship) Failure (parachute)

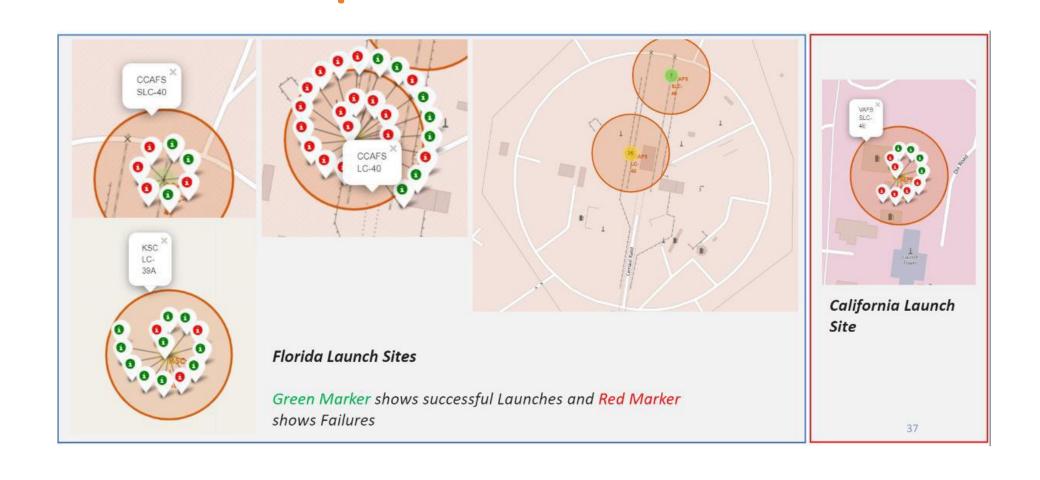

Rank the count of landing outcomes (such as Failure (drone ship) or Success (ground pad))

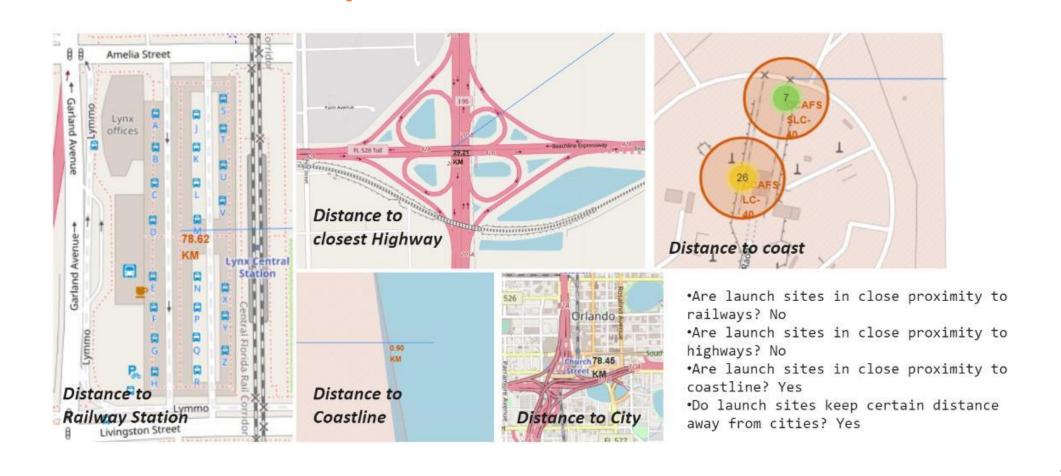

### <Folium Map Screenshot 1>

## <Folium Map Screenshot 2>

## <Folium Map Screenshot 3>

### < Dashboard Screenshot 1>

Replace < Dashboard screenshot 1> title with an appropriate title

• Show the screenshot of launch success count for all sites, in a piechart

• Explain the important elements and findings on the screenshot

### < Dashboard Screenshot 2>

• Replace < Dashboard screenshot 2> title with an appropriate title

• Show the screenshot of the piechart for the launch site with highest launch success ratio

Explain the important elements and findings on the screenshot

### < Dashboard Screenshot 3>

Replace <Dashboard screenshot 3> title with an appropriate title

• Show screenshots of Payload vs. Launch Outcome scatter plot for all sites, with different payload selected in the range slider

• Explain the important elements and findings on the screenshot, such as which payload range or booster version have the largest success rate, etc.

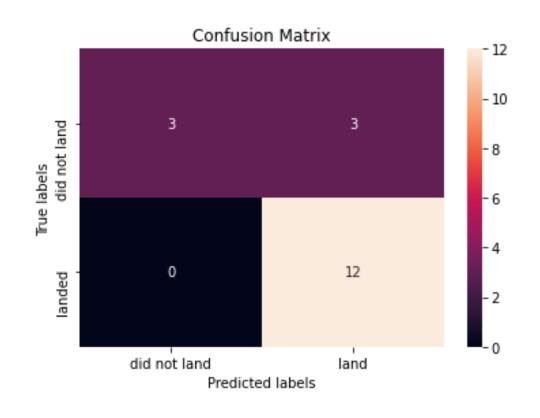

## Classification Accuracy

 The decision tree classifier is the model with the highest classification accuracy

Best params is : {'criterion': 'gini', 'max depth': 6, 'max features': 'auto', 'min samples leaf': 2, 'min samples split': 5, 'splitter': 'random'}

## Confusion Matrix

 The confusion matrix for the decision tree classifier shows that the classifier can distinguish between the different classes. The major problem is the false positives .i.e., unsuccessful landing marked as successful landing by the classifier.

### Conclusions

- We can conclude that:
- The larger the flight amount at a launch site, the greater the success rate at a launch site.
- Launch success rate started to increase in 2013 till 2020.
- Orbits ES-L1, GEO, HEO, SSO, VLEO had the most success rate.
- KSC LC-39A had the most successful launches of any sites.
- The Decision tree classifier is the best machine learning algorithm for this task.

## Appendix

 Include any relevant assets like Python code snippets, SQL queries, charts, Notebook outputs, or data sets that you may have created during this project
